[crayon-6a9d50a4c5e8c014184964/]

The screenshot shows a Windows PowerShell ISE window with a script that fetches stock prices from the Bolsa de Madrid website. The script uses `Invoke-WebRequest` to get HTML data for a list of stock tickers, then uses `Where-Object` and `ForEach-Object` to parse the prices. The output is a list of company names and their current prices.
