

Windows PowerShell 7 Preview 6

This release contains a number of new features and many bug fixes from both the community as well as the PowerShell team. See the [Release Notes](#) for all the details of what is included in this release.

This will be the **last preview release** as we head towards a Release Candidate in December. For the Release Candidate, there will be no more new features although small changes to cmdlets may still be accepted depending on risk of the change. Bug fixes will still be accepted but also accepted for their risk of causing a regression. Finally, we expect General Availability of PowerShell 7 in January as our first Long Term Servicing release.
