

Saving Data to a Text File

The primary use of Set-Content is to write data to a text file. For example, this command writes the text «This is a test» to the text file C:\Scripts\Test.txt:

```
[crayon-6a9d7870a88a3434386409/]
```

Note that this replaces the existing contents of Test.txt with the new text specified in the command. To append text to a file, use the Add-Content cmdlet.
