

Changing a Computer's Date and Time

One way to change the date/time on a computer is to use the `-date` parameter followed by the new date and time. For example, suppose you want to set the date and time to 1:11 AM on June 6, 2015. Here's how you do that:

```
[crayon-6a9d66aa78067919992260/]
```

Need to set the clock ahead exactly two days? This command uses the `Get-Date` cmdlet and the `AddDays` method to advance the clock two days:

```
[crayon-6a9d66aa78070711032918/]
```

Other methods that can be used here include `AddHours`, `AddMinutes`, and `AddSeconds`. Need to set the clock back 1 hour due to Daylight Saving Time? Then simply set the clock back `-1` (minus 1) hours, like this:

```
[crayon-6a9d66aa78073326272795/]
```

Alternatively, you can use the `-adjust` parameter to adjust the time using the format `hours:minutes:seconds`. For example, this command sets the clock ahead 1 hour and 11 minutes

```
